

**You don't need to go back to school to solve your audio component needs!**

Transducers is the leader in sound problem solutions. In addition to our large offering of off the shelf sounder products, we also have designed and developed dozens of sound I/O devices to fill the needs of many unique applications. We offer special designs in microphones, piezo electrics, and micro speakers.

Here is just a few of our many products that have gone under some sort of customization:

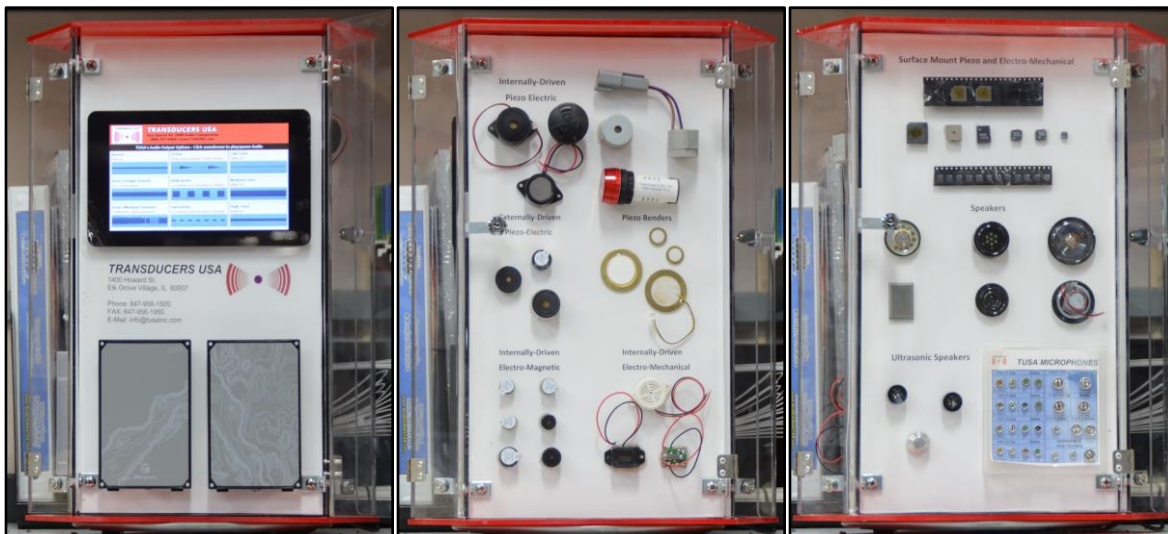

Our **KEC2742** offers a variety of mounting, terminations and is IP67 rated.

Our **TRS-2804** series is a one-inch square, high watt output speaker with a wide frequency range and a mylar membrane for moisture protection.

Introducing our newest product, the **TRIP-2612P**. This is a one-of-a-kind part with a **low 400 Hz frequency piezo** which compares to all electromechanical buzzers. This part is still in the development process so keep an ear open for this product because we will be releasing more information about it later this year!

**Don't forget to ask us about our brand-new display case to show off!**

**SEND US YOUR AUDIO COMPONENT NEEDS AND WE WILL SOLVE THEM!**
